<p>Document DE 42 10 816 is considered the prior art closest to the subject matter of claim 1. Said document discloses (the references in parentheses relate to said document) a soil cultivation appliance having an asynchronous rotary current motor for driving a rotary cultivation tool.</p> <p>The significant disadvantage of this known device is that, if the soil is uneven, it is very difficult to handle and requires a great deal of physical strength on the part of the user.</p> <p>This state of affairs is addressed by the characterising features of claim 1. According to the invention, a frequency converter is provided having a hand-adjustable frequency for controlling the rotary current motor. In addition, so as to maintain a sufficiently large torque in low ranges of rotational speed, the rotary current motor has a large number of winding grooves or poles.</p> <p>This development or design of the drive of the device is novel (PCT Article 33(2)) over DE 42 10 816, since said publication in no way indicates how the rotary current motor is driven. be selected such that the tools rotate at half-speed, which leads one to assume a pole-convertible motor, this publication contains no suggestions whatsoever as to the manner in which the motor is controlled.

The *Auslegeschrift* DE 1 298 743 shows a potentiometer whose tap is driven by a motor controlled by a frequency converter. Said device cannot be compared to the present invention since the functional assignation of the main components, namely the potentiometer, motor and frequency converter, is fundamentally different from the present invention. The soil cultivation device as per claim 1 is therefore not suggested by the combination of document DE 42 10 816 and DE 1 298 743 and is therefore inventive (PCT Article 33(3)).

Claims 2-12 relate to preferred embodiments of the claimed subject matter and meet, as dependent claims, the requirements of PCT Article 33(2) and (3).

Industrial applicability (PCT Article 33(4)) is clearly established.
